

Cerberus® AlgoRex

Manual call point

AnalogPLUS

DM1131
DM1132
DM1133
DM1134

- Manual call point for the Cerberus fire detection system AnalogPLUS
- Individual identification of detectors
- Built-in line disconnection function
- LED to indicate switching status
- Two-wire installation
- Manual call point DM1131 with direct operation
 - For surface and recess mounting in clean, dry rooms
- Manual call point DM1132 with direct operation
 - For inside and outside applications in humid, wet and dusty areas (surface mounting)
- Manual call point DM1133 with indirect operation and DM1134 with direct operation
 - For surface mounting in dry and wet rooms

Application

For immediate manual activation of alarm or extinguishing in the event of fire. The manual call points are mounted at easily accessible and visible locations.

Manual call point DM1131 / DM1132

Direct operation. The glass plate is broken in the centre by thumb pressure which operates the switch and activates the electronics, so transmitting the danger signal via the two-wire detection line to the control unit.

Reset. By exchanging the glass plate, the switch reverts to its normal position so making it ready for operation again.

Performance check. Using a special tool, the call point can be tested for correct operation externally.

Address allocation when the call point is activated for the first time.

Manual call point DM1133

Indirect operation. The built-in switch is operated by breaking the glass and pressing the button firmly. This activates the electronics which immediately transmits the danger signal via the two-wire detection line to the control unit.

Reset. Upon closing the manual call point, the button is reset and is once again ready for operation.

Performance check by opening the manual call point and pressing the button.

Address allocation when the call point is activated for the first time.

Manual call point DM1134

Direct operation. Upon breaking the glass, the button is tripped and activates the built-in switch. This activates the electronics which immediately transmits the danger signal via the two-wire detection line to the control unit. The manual call point can be opened with a key to exchange the glass plate.

Reset. Upon closing the manual call point, the button is reset and is once again ready for operation.

Performance check by opening the manual call point.

Address allocation when the call point is activated for the first time.

Installation

DM1131 / DM1132

The DMZ1191 box for surface mounting or the DMZ1192 box for recess mounting is required during the wiring phase of the DM1131. The DM1132 is supplied completely with surface mounting.

- Knockouts are provided for cable entry as required.
- Concealed lines can be fed through the base of the box.
- The manual call point is only mounted after the wiring has been checked, shortly before commissioning.
- The manual call point is supplied with glass plate printed with a pictogram. A 2mm Allen key is necessary to exchange the glass plate.

DM1133 / DM1134

The manual call points comprise the housing DMA1192 and the electronics unit DMA1133 resp. DMA1134.

- The housing is required during the wiring phase. The electronics unit is only mounted after the wiring has been checked, shortly before commissioning.
- A PG11 cable entry is provided at the top and bottom of the housing.
- Concealed lines can be fed through the base of the housing.
- When additionally using packing DMZ1197-AD manual call points may also be used in wet environments.
